

UI Design and Prototyping

English to Sinhala Translation

Introduction

The basic idea is to realize throughout specialization, a site for translating English to Sinhala with pronunciation based typing in English and letting the user to change the font type as they prefer.

Expected List of Features

The site will most likely include the following features.

- Homepage → With a presentation of the website, with links to main areas
- English typing area → Where the user can enter an English word with Sinhala pronunciation
- Converting area → converting that into Sinhala
- Font selection area → Letting the user to change the Sinhala font

There are various Sinhala font faces available and the alphabet contains more than 60 characters with specializations over 100. So it is complex to change the font faces accordingly. So most of the sites tend to use only one font face

This can be acquired with a simple UI design.

The UI design I came up with is shown below.

UI Design
